Enhancing Dust Management through Integrated Data and Proactive Risk Forecasting to Minimise the Impact of Open Pit Mining

This study highlights a leading European metals company, focusing on their copper mining operations in Sweden. This site experiences dust emission issues caused by environmental and geographical factors. Operations have implemented proactive technology to improve their dust management strategies. This has resulted in tangible benefits for workers and the local community while supporting the mine's commitment to environmental responsibility.

Highlights:

- Improved environmental compliance through data integration Optimised resource allocation for dust control using real-time data
- Strengthened community relations with transparent communication
- Proactive risk assessment through operational dust forecasting
